## Secure Event Log Archiving and Analysis

In today's business age of escalating security costs and mounting regulatory standards, enterprises can no longer afford to ignore the significance of their log files. And with a resounding focus on corporate and government regulations and standards, organizations must be able to prove they're in compliance at all times, or risk subjecting themselves to considerable penalties.

With everything from servers, workstations, applications, and services quietly filling disk partitions one log at a time, event logs are home to a wealth of information regarding your enterprise, including key forensics pertaining to security policies, audits and regulatory compliance. However, the task of securely archiving this data for long term storage can be both time-consuming and painful if done manually.

NetPro's LogADmin enables effective long term event log archiving and analysis in a controlled, scalable environment, giving your organization an efficient and cost-effective solution to meet its security and compliance requirements - without the time-consuming complexity of native tools. With LogADmin, your IT staff is empowered with a clear vision of your environment, enabling them to resolve outstanding issues before they reoccur and easily providing the proof your organization needs to demonstrate compliance.

### Compress, Encrypt and Archive Distributed Windows Event Logs

LogADmin is an enterprise log archiving and analysis solution that securely compresses and copies event logs in their original format to a central location for long term storage. Windows administrators can archive distributed logs using local or remote agents, providing targeted load sharing and fault tolerance by leveraging NetPro's Enterprise Server technology. With LogADmin, you can rest assure that log files are encrypted and compressed prior to consolidation, then stored in a secured central archive.

### Dynamically Adjust to Varying Environments

Changes to your environment shouldn't have to affect the way you collect information. And now they don't have to. As new servers are brought online, LogADmin can be configured to automatically include them in the log archival process.

## COMPLIANCE

---

### LogADmin Capabilities...

Efficient Log Archival for Windows 2000, Windows 2003 Servers and XP Desktops

Flexible deployment to support global needs

Local and Remote Collection

Built-in encryption and compression of log data

Customizable port assignment

Built-in fault tolerance and load sharing capabilities

Support for Windows 2000, Windows 2003 and XP, (Vista planned)

---

## LogAdmin at a Glance

- Fulfills** audit requirements by providing a secured audit history of all events in a compressed and encrypted format
- Enables** centralized log retrieval and management using a simple interface
- Teams** with NetPro's ChangeAuditor for real time monitoring, notification and analysis of critical security events
- Simplifies** historical forensic analysis with sorting and filtering capabilities
- Maintains** storage requirements by compressing log data to save disk space
- Ensures** security through AES strong encryption, one of the most popular algorithms used in symmetric key cryptography
- Provides** auditors or non-administrators with secure access to review selective archived log data

### 4 Easy Steps to Secure Archiving with LogAdmin:

1. Specify the targeted computers for log collection
2. Define which logs to collect
3. Schedule the collection
4. Select the agent groups for servicing the task

*LogAdmin's user-friendly interface allows you to quickly and efficiently retrieve the archived logs for efficient searching, sorting and analysis.*
